Create Create & create another Cancel

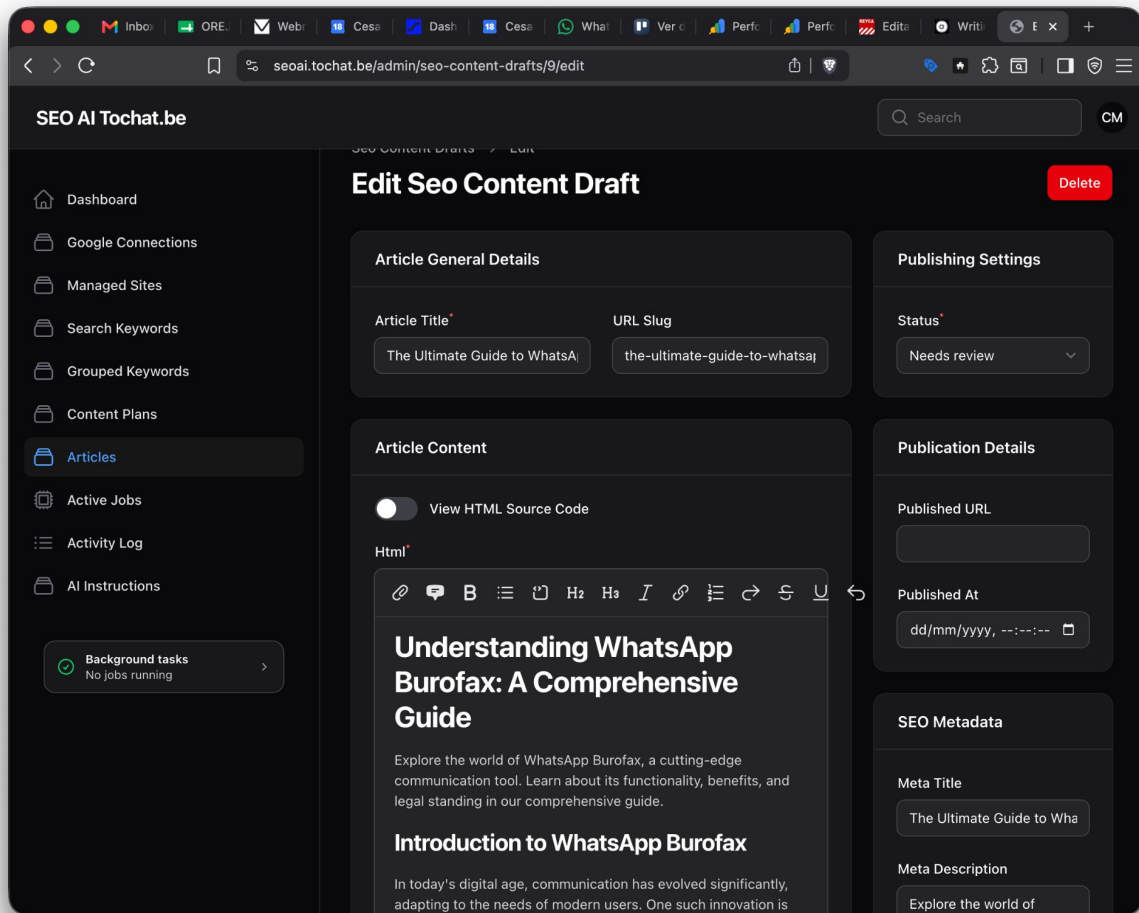

We need to understand how this works. Should be more simple. **But let's talk about it.**

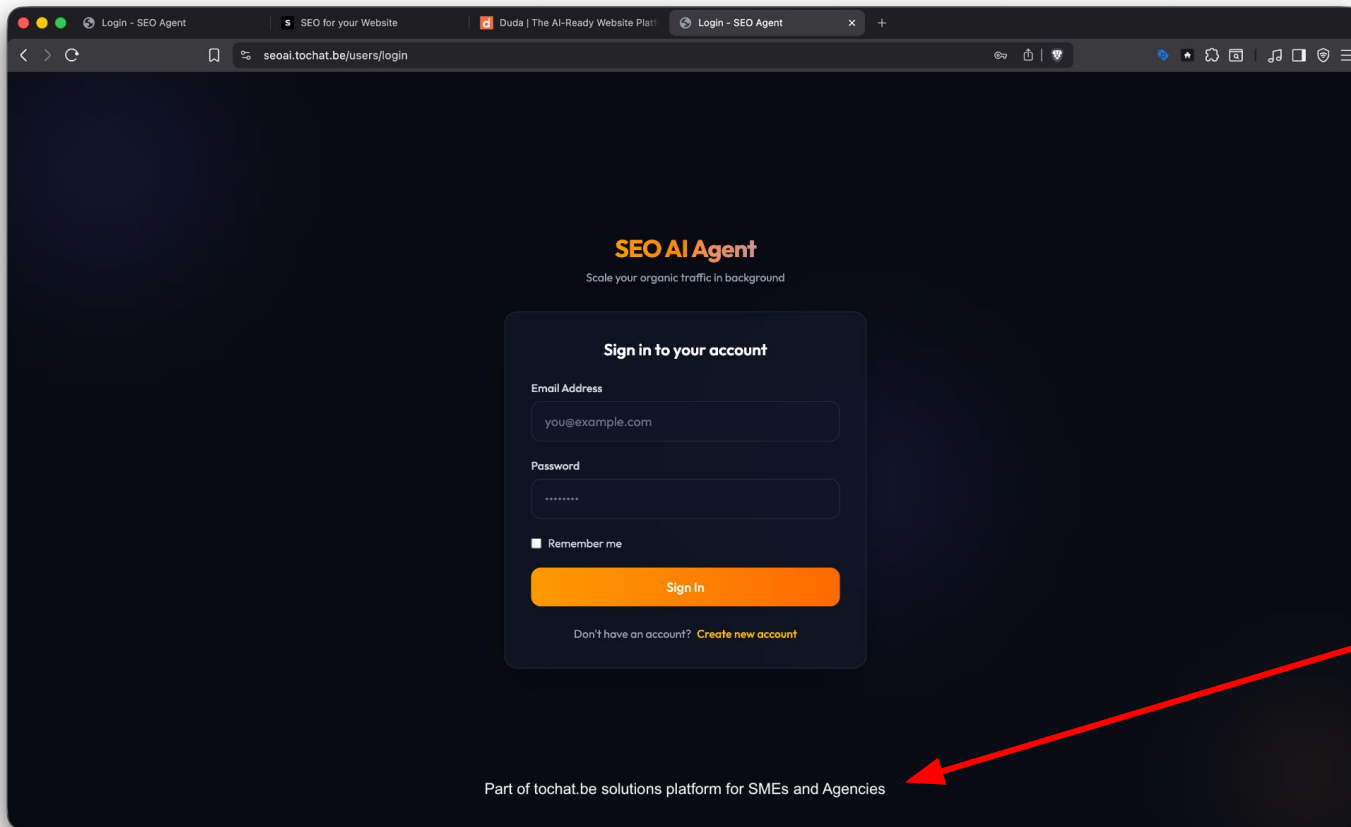

Filters **NOT**
WORKING

Review emails and automation:

https://docs.google.com/presentation/d/1ISp_d9PZMoF844S7_RKJcNUsPoxTTX9KuEWKOdrE8Wc/edit?slide=id.p#slide=id.p

I choose
spanish to
create content
and it is not
working. The
content is in
english.

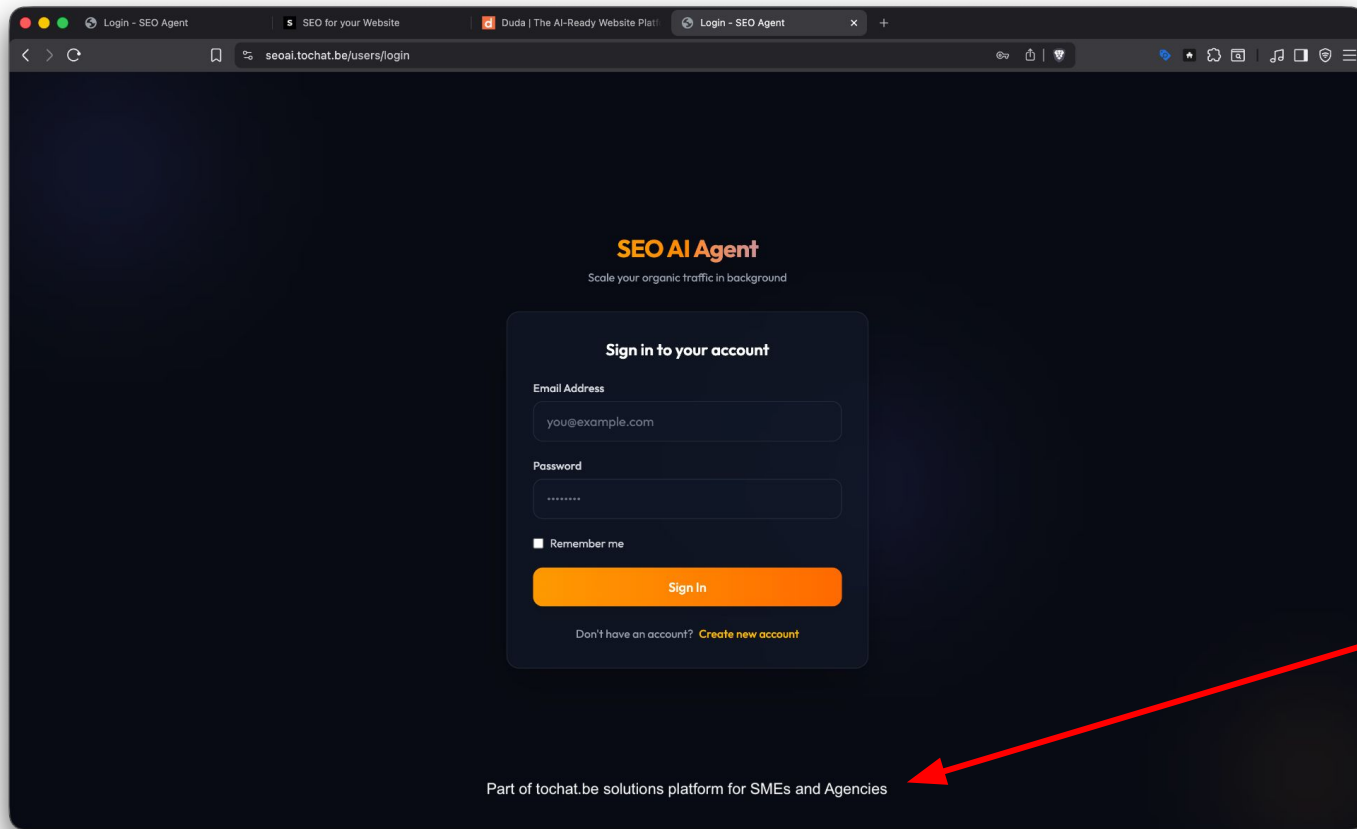

Add a footer to link
the 3 sites.

Create a webhook or service where we can consume the content generated by the AI.

The idea is to be able to publish the content automatically.

1. Using a WordPress Webhook Plugin

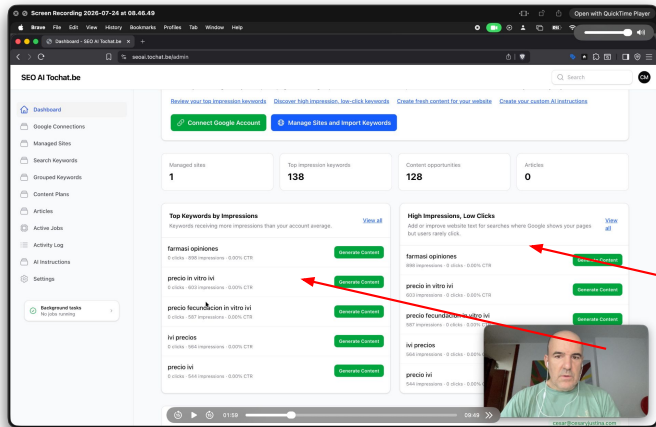

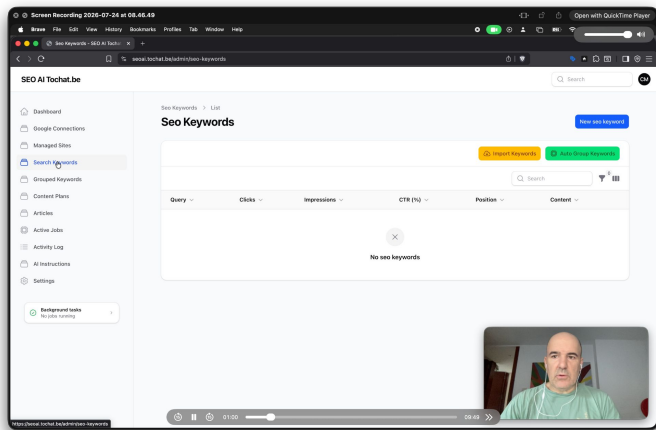

The easiest and most common way to natively receive data on your site is to install a dedicated webhook plugin.

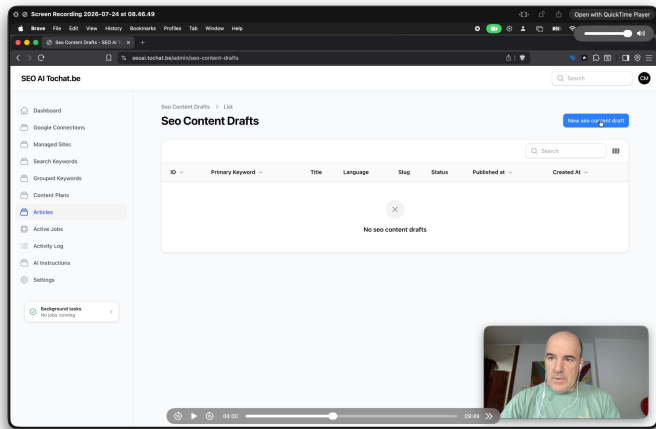

- **WP Webhooks:** This is one of the most popular plugins for this task. It includes built-in "Action" listeners that allow you to receive a payload (JSON, XML, or form data) from an external app or custom script and instantly create a new post, page, or custom post type. [[1](#), [2](#), [3](#)]
- **How it works:** You generate a unique endpoint URL in the plugin, map the incoming data (e.g., matching the external tool's "Title" and "Body" to WordPress's corresponding fields), and the plugin takes care of publishing the content. [[1](#), [2](#)]

2. Using Automation & Integration Platforms

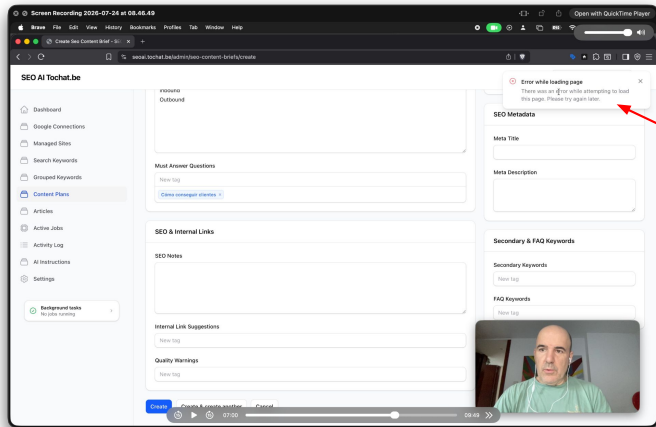

If you do not want to code or deal with custom payload parsing, you can use no-code integration tools to act as a bridge.

- Tools like **Zapier Integration for WordPress**, **Make**, or [Pabbly Connect](#) have pre-built connections to WordPress.
- **How it works:** You set the third-party tool to catch the webhook from your content source (like a form, an AI generator, or another CMS), and then configure the tool's WordPress action to **"Create Post."** [[1](#), [2](#), [3](#), [4](#)]
